

Guest Video Protection

www.guest.video

The Guest Video Protection plugin enables the display of copy protected pages and media by embedding them into existing pages and posts.

The Guest Video service is most unique in that it is:

- The only web hosting service that includes options for DRM and copy protection.
- The only copy protection solution that includes secure file hosting.
- The only WordPress plugin that provides real copy protection.
- Fully supported on all computers and devices including mobile phones.

How that is possible is because it is not just a plugin, but an interface for using the most sophisticated copy protection solution ever imagined.

How It Works

Guest Video uses the ArtistScope Site Protection System (ASPS) to create a secure tunnel between our server and your site visitor's device in which nothing can be copied or saved.

The pages displayed in the iFrame on your web page are most securely encrypted and cannot be decrypted or displayed in normal web browsers. Instead the ArtisBrowser is used to display your web pages and while on display they cannot be copied in any way.

Normal Web Browsers

While some consider that using a normal web browser is important for popularity, it is a complete waste of time if you want copy protection safe from all avenues of exploit. Popular browsers are useless for copy protection because they designed to do just the opposite... save, copy and download anything that they can get to.

Any plugins claiming to provide copy protection for normal browsers are useless because being based on HTML and JavaScript, they have no rights to control at system level.

We invented copy protection for the web in 1998 and used to provide copy protection for all web browsers via plugins. But they outlawed that technology in 2015 and quite frankly, while that has been an inconvenience to those dependent on protecting their livelihood, by using ArtisBrowser our clients are no longer building on quicksand.

Getting Started

To use the Guest Video service on your web site:

1. Install the **Guest Video Protection** plugin.
2. Create a free 14-day free trial by registering at <https://guest.video/join.asp>

Guest Video Pages and Media

This solution provides file hosting for web pages, images, PDF and video. This plugin can embed both web pages and media into your web pages, however that content is managed from your dashboard at Guest Video. So any pages that you embed need to be created at the Guest Video end, and any media that you embed such as PDF and video needs to be uploaded from your dashboard at Guest Video.

Guest Video Protection Settings

Guest Video Protection settings are managed from your dashboard at guest.video. Guest Video *pages* include options for DRM, copy protection and watermarking. Guest Video *media* use copy protection and watermarking (no DRM).

Embedded Page Layout

Guest Video pages can be published as standalone web pages and include text, images, and video like any web page with headings, bullet points, etc. The editor available from your Guest Video dashboard is quite sophisticated and can also set individual DRM, copy protection and watermarking options.

Regardless of page layout, when displayed by this plugin, the menus and footer are removed for the page to shown as large as possible in the available space on your page.

Media Layout

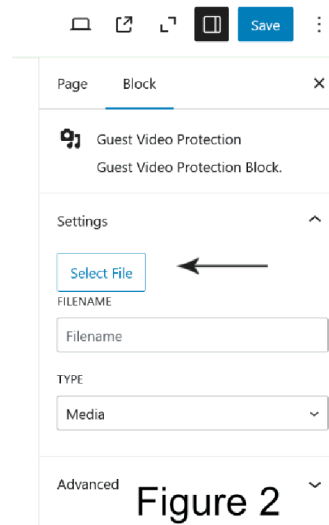

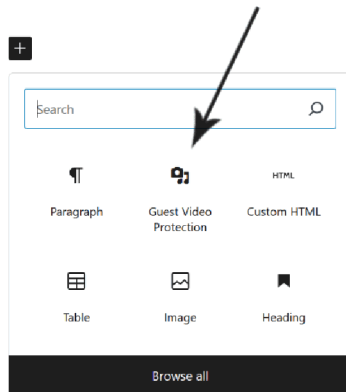

When embedding media only, such as PDF, mp4 video or images, only the media is displayed. However that media will be automatically rescaled to to suit the available width. Image and video height is adjusted to the new width, while PDF will rescale for an A4 portrait page.

Optimization Tip

To display PDF and video as large as possible, try displaying them on a page that is not encumbered with side menus.

Embedding Copy Protected Pages with the Gutenberg editor

Figure 1

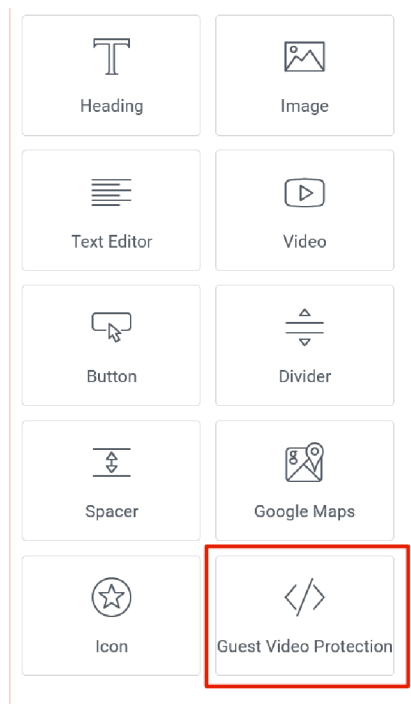

Click on the “Add Block” icon and search for “Guest Video Protection”. Click on the “Guest Video Protection” icon from Figure 1.

Once clicked, the “Guest Video Protection” settings will display. Click on “Select File” which is shown on Figure 2. This will show a popup containing your media and page list.

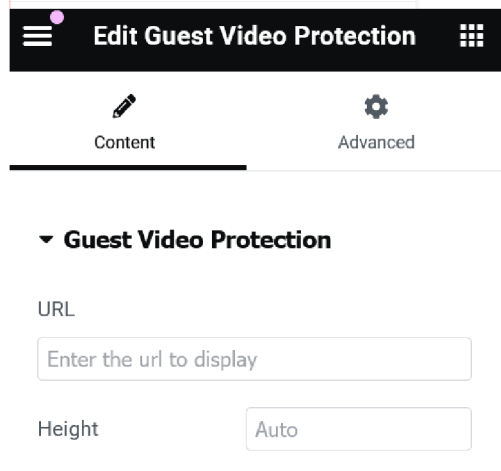

Select a media or page from the popup and click on “Insert”. Save the page after.

Embedding Copy Protected Pages Using Elementor

Click on the “Guest Video Protection” button on the left side on the Elementor editor page.

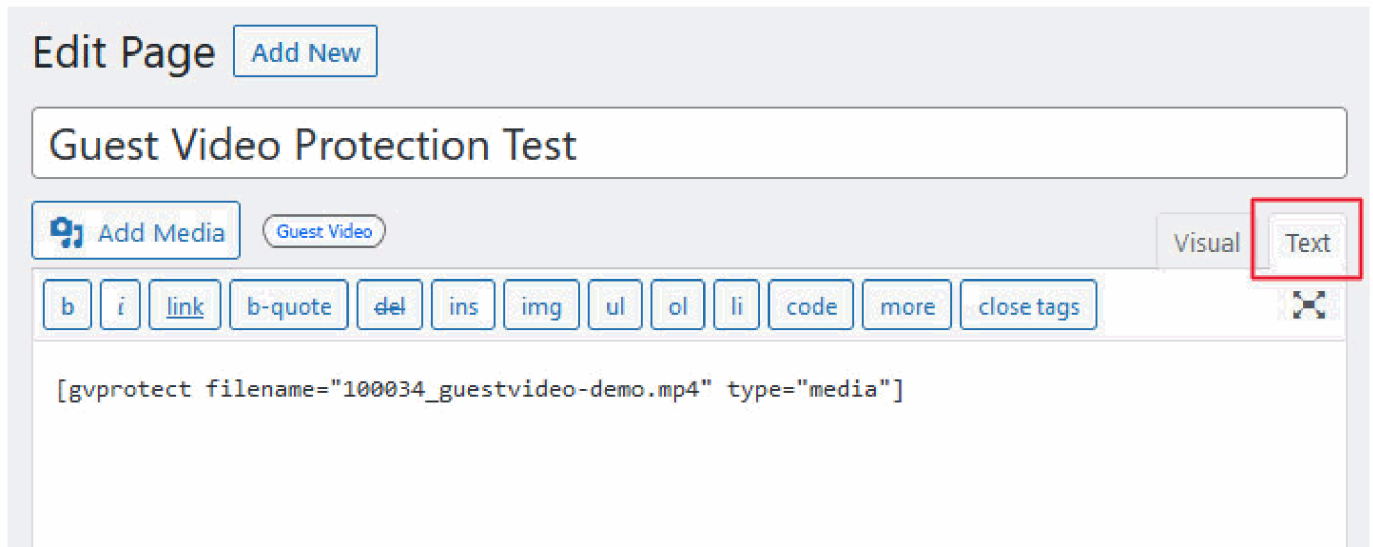

Once clicked, the widget will be placed on the editor and the left side section will update to show the screenshot below.

Insert the full link to your Guest Video page.

Embedding Copy Protected Pages with the Classic Editor

If you have the Classic Editor plugin installed you can click on the [Guest Video] button in the toolbar to insert Guest Video content at the current cursor position.

Embedding by Pasting the Shortcode

You can copy'n'paste the shortcode (using view source):

`[gvprotect filename="100034_guestvideo-demo.mp4" type="media"]`

`[gvprotect filename="100034-test-page-for-wordpress" type="page"]`

Troubleshooting

If your content is not displaying, check that the shortcode was added while in TEXT mode.

If you still have problems, email a detailed description of what you did to arrive at the error from the support form at <https://guest.video>
